# HIGH POWER BUSBAR PRODUCT SELECTION GUIDE

XCP

# XCP IP65

## BUSBAR TRUNKING

**XCP IP65** is the Starline busbar trunking system ranging from 630 A to 6300 A with an IP65\* degree of protection. It is the most suitable solution for the transport and distribution of energy in data center applications – Offering **SAFETY, FLEXIBILITY** and **PERFORMANCE**.

### CERTIFICATION AND TESTS

The busbar trunkings have been tested and approved according to IEC 61439-6. Low voltage switchgear and controlgear assemblies. Part 6 refers to Busbar trunking systems (busways).

### Typical applications

- Data Center.
- Industrial.
- Commercial and service sector buildings (banks, hospital, trade activities, business centers).

\*The standard degree of protection is IP55. IP65 is available by request (only for transport of energy).

# XCP-S AND XCP-HP

## 2 PRODUCT LINES

The range of XCP busbars consists of 2 different product lines:

- XCP-S
- XCP-HP

While the same basic characteristics, such as the range of rated current, the construction materials and the same amount of accessories available, XCP-S and XCP-HP have different properties that make them able to satisfy the demands of various markets.

**XCP-S** is designed to be safe, flexible and capable of delivering 630-6300 amps. It is optimized for most power distribution situations. For standard applications that do not require higher performance, the XCP-S system's reduced sections of internal conductors provide a compact and lightweight solution.

**XCP-HP** is characterized by higher performance on energy saving and higher short circuit withstand capability. It is designed to work at 55 °C ambient temperature. Due to these features, XCP-HP is the ideal solution for heavy duty applications, higher temperature environments and installations where high energy efficiency is required.

XCP-HP Aluminum	SINGLE BAR configuration						DOUBLE BAR configuration			*	
XCP-HP Copper	SINGLE BAR configuration						DOUBLE BAR configuration				*

\*Triple bar

# RANGE COMPONENTS

XCP includes all the necessary components to allow any path for the busbar run that the project requires.

## The busbar system is composed of:

**STRAIGHT SECTIONS:** for transport and distribution (with tap off outlets) of high-power energy.

**ADDITIONAL ACCESSORIES:** to meet any installation requirement (fire barrier, phase inversion, etc.)

**ELBOWS:** meet any change of direction and plane with standard or special solutions.

**TAP-OFF BOXES:** for connecting and energizing electric loads. Available in plug-in and bolt-on versions. See page 12 for more details.

**CONNECTION INTERFACES:** for connecting the busbar to the electric board or transformer.

**MOUNTING SUPPORTS:** for mounting the busbar to the structure of the building, for horizontal and vertical installations and special applications (seismic areas).

## XCP is available in special versions upon request. Below are examples of special version codes:

REFERENCE	VERSION DESCRIPTION
64280102P	standard 4 conductors (3Ph + N + PE casing)
64280102P-R5	4 conductors RAL painted on request
64240102P	5 conductors (3Ph + N + FE + PE casing)
64250102P	double neutral
64280102P-3W	3 conductors (3Ph + PE casing)
64280102PF	Class F insulation (155 °C)
64280102P-RL	PEN conductor
64280102P-R3	with aluminum extra-ground (reinforced PE)
64280102P-R4	with copper extra-ground (reinforced PE)

### CONDUCTOR VERSIONS:

3 conductors + PE: for applications where neutral distribution is not required

4 conductors + PE: with pariphase neutral

4 conductors + PE: with double neutral with respect to the phase section for applications with

high values of third order harmonics (THD%)

5 conductors + PE: 3 phases + Neutral pariphase + FE functional earth + PE

### VERSIONS OF PE:

PE1 with casing used as earth conductor

PE2: with additional earth in alluminium plate

PE3: with additional earth in copper plate

# DESIGNED BETTER: SAFETY, FLEXIBILITY AND PERFORMANCE

## SAFETY

Tested and manufactured in accordance with IEC 61439-1 & 6, the XCP product line is designed to provide the highest safety levels from all aspects of design and installation. Features such as fire and seismic resistance, high-short circuit ratings, excellent ingress protection along with superior insulation technology help ensure that your critical operations team is always safe.

### Fire Resistance

In installations where there is a high risk of fire, the XCP Busbar trunking system solution can provide technical advantages. Thanks to the low fire load of the busbar, the safety of the building is much improved. XCP has been fire resistance tested in accordance with the IEC 60331-1 standard.

### Insulation Technology

To achieve superior quality and safety, XCP conductor bars are wrapped by two PET sheets, each of which is sufficient to ensure full required dielectric level. PET is a non-hygroscopic thermoplastic polymer resin and therefore preserves its performance whatever the level of humidity. For more information about the characteristics of this material, see page 96.

### Maximum Strength

The XCP range has been designed and manufactured to meet the requirements of the most demanding environments. The busbar is self-supporting and the degree of impact resistance of the casing which houses this line is the maximum stated in IEC EN60068-2-62: IK10.

### Electromagnetic Emission

The ferromagnetic structure of the casing and the compactness of the bars significantly reduce the electromagnetic field emitted. The magnetic induction measured at 1 metre from the XCP Busbar is much lower than 3μT which represents the "quality objective" of several countries.

### IP55, IP65 and Sprinkler Proof

XCP has an IP65 degree of protection for the transport of energy and an IP55 rating as standard for the distribution of energy, making it ideal for most every application. It is also possible to accessorize XCP with a sprinkler kit that makes the busbar system resistant to the sprinkler test.

SPRINKLER KIT

Tests under sprinkler conditions are available.  
For more information please contact Starline.

### Resistance to Seismic Events

All busbar systems are laboratory tested and guarantee the resistance to seismic events, if installed in accordance with the recommended procedures. The XCP-S and XCP-HP ranges and the related tap-off boxes, have obtained the passing of seismic tests at a value of ZPA 1.5g \* according to the regulations IEEE Std 693-2018. Considering that:  $ZPA\ 1.5g = 1.5 \times 9.81\ m/s^2 = 14.71\ m/s^2$ . The maximum acceleration value obtained corresponds to extremely intense earthquakes.

# FLEXIBILITY

With **XCP**, the design and installation of the power distribution system becomes simple and fast.

The product is Xtra-compact, efficient, and easy to install with features and accessories that make planning and designing your critical infrastructure project easy. With both a Standard (XCP-S) and High-Performance (XCP-HP) series, a current range of 630-6300A, copper or aluminum conductors, a full range of components and power connections, and tap-offs up to 1250A, the XCP product line can be configured for any project, including multi-floor distribution.

## Outlet Windows

Outlet windows located on the straight sections provide high management flexibility throughout the project phases, as well as for future adaptability.

## Pre-Installed Monobloc

In order to facilitate ease of installation and reduce installation time, the sections utilize a monobloc preinstalled at the factory and the connections between them are keyed, which ensures installation of the components in the correct position.

## PSSL software

PSSL is a proprietary software to support the design of busbar trunking systems. It transforms a graphic project into a list of materials (including mandatory accessories) to get an offer identical to the final design. PSSL is fully compatible with the latest versions of Autocad and Revit (and previous versions of both programs).

With this software you can:

- draw the layout of the distribution system;
- automatically obtain the material list (including accessories) from the drawing;
- export the drawing to Autocad® and Revit®\*\*

\* For more information about the request and use of the Starline PSSL software, please contact Starline.

\*\* Autodesk Revit is a building information modeling software for architects, landscape architects, structural engineers, MEP engineers, designers and contractors. The software allows users to design a building structure and its components in 3D, annotate the model with 2D drafting elements, and access building information from the building model's database.

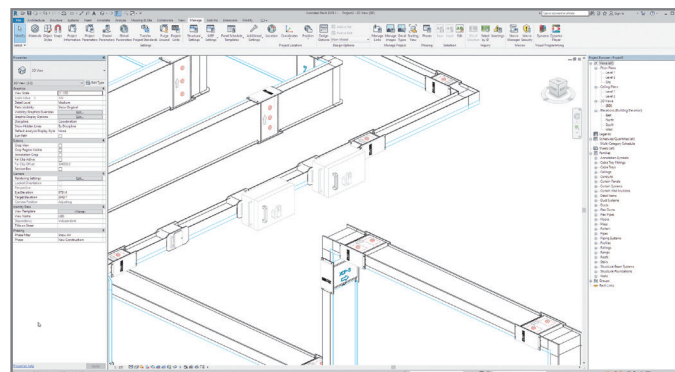

\*The standard degree of protection is IP55. IP65 is available by request (only for transport of energy).

With PSSL\* you can have a detailed list of the item codes that are found in this catalogue. Furthermore, the possibility to export the drawing to Autocad or Revit\*\*, allows you to enter the paths of the busbar directly into the design of the building and to follow any design changes quickly and professionally.

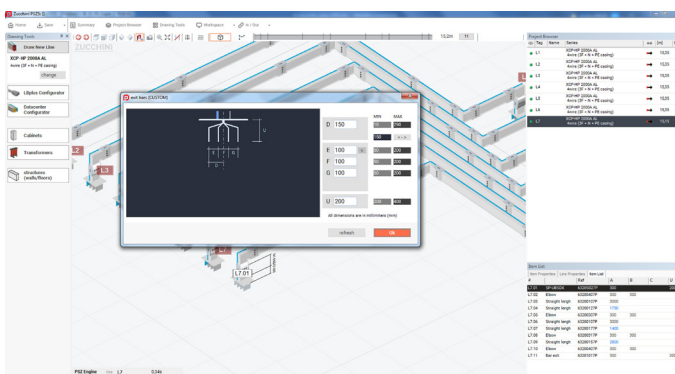

EXAMPLE OF A DRAWING EXPORT IN AUTOCAD

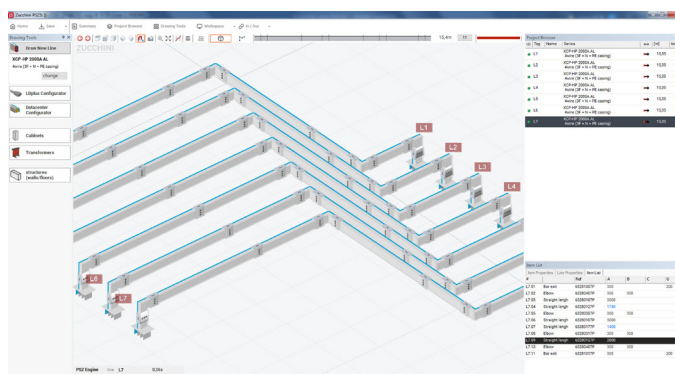

EXAMPLE OF THE DRAWING EXPORT IN REVIT

The new release of the program has been implemented with new features that make PSSL even more complete and performing.

SPECIAL UB MANAGEMENT FUNCTIONS

POSSIBILITY TO MANAGE SINGLE PIECES THROUGH A NEW ALGORITHM ABLE TO OPTIMIZE ROUTES

\*g=9,81m/s2 (gravitational acceleration)

# PERFORMANCE

The XCP product line provides exceptional performance for the most demanding critical power applications. It provides high reliability in all environments and cost saving through its innovative design.

## High Ambient Temperature

XCP's optimized design of the conductors and insulating material provides a benefit for high-temperature environments. The industry leading, high-ambient temperature operation of (55° C) means that XCP can be fully loaded with no derating necessary, even in the most extreme environments.

## High Short-Circuit Ratings and Operational Voltage

Reliability and availability of your high power distribution system are safeguarded through industry leading short-circuit ratings and a high operational voltage (Ue=1000 V).

## Low Electrical Losses

XCP ranges have low voltage drop due to the sandwich busbar design, reducing impedance, and making longer runs of busbar feasible. Significant energy savings can be further realized with the XCP-HP product line, with a typically very short pay-back period.

## Maximum strength

The busbar is self-supporting and the degree of impact resistance of the casing which houses this line is the maximum stated in IEC EN60068-2-62: IK10.

## Electromagnetic emission

The ferromagnetic structure of the casing and the compactness of the bars significantly reduces the electromagnetic field emitted. The magnetic induction measured at 1 meter from the XCP Busbar is much lower than 3µT which represents the "quality objective" of several countries.

# PRODUCT FEATURES

## Xtra-compact design

**XCP** is available with aluminium or copper conductors and it is characterised by a smart and ultra-compact design. The external dimensions don't change in base of number of conductors: length and height change with the rating, but are the same for all 3 combinations of conductors (3 - 4 - 5 conductors).

STANDARD  
BUSBAR

XCP

Often the transport and distribution of high power (5000A Al /6300A Cu rated current) consists of two parallel independent busbars. **With XCP, multi-bar design is always supplied in a single structure** making it simpler to install compared to independent run designs.

XCP is available in aluminium versions (630 - 5000 A)  
or with copper conductors (800 - 6300 A)

ALUMINIUM CONDUCTORS

COPPER CONDUCTORS

# PRODUCT FEATURES

## End feed unit for rising mains

Feed units are used at the start of the riser mains lines, when the busbar must be placed to the wall and powered using cables. These feed units allow you to install the product at a minimum distance of 40 mm from the wall.

## Patented monoblock

Starline's XCP line is equipped with a monobloc covered by a Legrand patent. This new monobloc ensures a better connection of the junction with less contact resistance. The insulation parts of monobloc are made by thermo-set insulation material Class F (155°C) and for each conductor there are two plates that assure the continuity between each conductor. A system of Belleville washers assure the correct pressure also during thermal expansion of the conductors. A double head nut breaks when reached the nominal Torque (85 N·m). In the double/triple configurations, the monobloc assure the current balancing on the same conductors.

## SmartBolts®

Smart bolts are available on request. These bolts are equipped with a visual indication system that turns from red to black when you reach the right tightening torque (85 N·m). They are also useful after installation and during maintenance operations because they allow you to see at a glance if a bolt has become loose or lost the right torque by turning back to red.

DOUBLE HEAD NUT THAT BREAK AT NOMINAL TORQUE (85 N·M) DURING 1ST INSTALLATION

DTI (Direct Tension Indicating) SmartBolts are specialty fasteners with a built-in indicator that shows the tension that is developed as the bolt is installed.

SMART BOLT®

# FIBERGLASS AND METAL TAP-OFF BOX

XCP distribution systems are equipped with outlets suitable for the **range of dedicated tap-off boxes**.

The tap-off boxes are available in 2 different construction materials:

- 25% fiberglass up to 250 A
- sheet metal case up to 1250 A

They are **universal** and therefore **usable on both XCP-S and XCP-HP**.

## The tap-off boxes guarantee:

Safety, optimized dimensions, reduced maintenance costs and are ready for MCB/MCCB circuit breakers.

The design of the outlets allows the installation of fiberglass plastic tap-off boxes, in addition to the metal versions range. **The degree of protection of the outlets and the system is IP 55.**

Tap-off boxes for XCP are available in 2 different materials: fiberglass and metal sheet, both characterised by a simple installation and fast connection thanks to the new layout of the hooks that offer safety and assembly speed. Tap-off boxes can be installed and removed when the busbar is energised.

### Fiberglass version:

- Range from 63 A to 250 A
- Optimized installation of Starline circuit breakers (MCB/MCCB)
- Optimized for IEC 60309 outlets
- Ideal for data center applications
- Empty version or with fuse carriers available
- Total insulation (no metallic parts from inside to outside)
- Able to be installed and uninstalled under live voltage

FIBERGLASS VERSION FROM 32 A TO 250 A

### Metal version:

- Range from 63 A to 630 A
- Optimized for installation with circuit breakers from various manufacturers
- Optimized for IEC 60309 outlets
- Ideal for data center applications
- Empty version or with fuse carriers available
- Equipped with:
  - anti movement security system
  - anti accidental closing and opening of the box
  - locked screws that will not loosen
  - blocked opened cover
  - safer vertical installation (the cover remains in an open position)
- Able to be installed and uninstalled under live voltage

METAL VERSION FROM 63 A TO 630 A

### How to accessorise tap-off boxes

Tap-off boxes are ready for equipment with Legrand circuit breakers and outlets.

## Selection of the busbar on the base of rated transformer data

### Technical Information

When planning the development of a power supply system, it's necessary to consider the technical specifications and standards of single items, as well as the technology and economy correlations.

Each piece of electrical equipment (transformers, panel boards, busbars, protection devices) must be selected after correct dimensioning in order to represent a coherent selection inside the whole system, not just individually. All the component must be correctly dimensioned to support loads peak in the event of a fault or during rated current operations.

RATED CURRENTS AND SHORT-CIRCUIT CURRENTS OF STANDARD TRANSFORMERS						
Rated power [kVA]	Rated voltage Un					
	400V, 50Hz			690V, 50Hz		
	Rated short circuit voltage Uk			Rated short circuit voltage Uk		
		4%	6%		4%	6%
Rated current In [A]	Short circuit current Ik [kA]		Rated current In [A]	Short circuit current Ik [kA]		
400	577	14,4	9,6	335	8,4	5,6
500	722	18,0	12,0	418	10,5	7,0
630	909	22,7	15,2	527	13,2	8,8
800	1.155	28,9	19,2	669	16,7	11,2
1000	1.443	36,1	24,1	837	20,9	13,9
1250	1.804	45,1	30,1	1046	26,1	17,4
1600	2.309	57,7	38,5	1339	33,5	22,3
2000	2.887	72,2	48,1	1673	41,8	27,9
2500	3.608	90,2	60,1	2092	52,3	34,9
3150	4.547	113,7	75,8	2636	65,9	43,9
4000	5.774	144,3	96,2	3347	83,7	55,8

$$I_n = \frac{P}{\sqrt{3} \cdot U_n} \leftrightarrow P = I_n \cdot \sqrt{3} \cdot U_n \quad I_k = \frac{I_n}{U_k} \leftrightarrow I_n \cdot I_k = I_k \cdot U_n$$

Crossing the busbar datasheet with previous chart, the proper busbar trunking systems can be selected. The first selection parameter for appropriate busbar is linked to transformer's rated current In (lower than rated current of selected busbar). The second parameter to be evaluated is short-circuit rating of busbar trunking system, which usually must be higher than transformer's peak short-circuit current Ik.

**NOTE:** previous consideration applies if just a single transformer is used for LV supply. For system with ring, meshed network or with transformers connected in parallel, the short-circuit current Ik increases (i.e. Ik double if two transformers in parallel).

### Selection example:

As practical example, given a transformer  
 P = 1000 kVA  
 Uk = 6%  
 Un = 400 V  
 from previous calculation and table,

$$I_n = \frac{P}{\sqrt{3} \cdot U_n} \rightarrow I_n = \frac{1000000}{\sqrt{3} \cdot 400} = 1443 \text{ A ;}$$

$$I_k = \frac{I_n}{U_k} \rightarrow I_k = \frac{1443}{6\% \cdot 1000} = 24,05 \text{ kA}$$

from here:  
 possible choice of XCP-S (50 Hz, Al, 4C) having In=1600A and short-circuit rating Icw = 42 kA or XCP-HP (50 Hz, Al, 4C) having In=1600A and short-circuit rating Icw = 70 kA

## Temperature impact on the rating of the busbar trunking system

### Technical Information

The ambient temperature where the busbar trunking system is installed impacts rating. During the design stages, it will be necessary to multiply the rating value at the reference temperature by a correction coefficient referred to the final operating temperature.

All Starline products have been sized and tested for an average ambient temperature of 40 °C. For installation in environments with average daily temperatures lower than 40 °C, the rated current of the busbar must be multiplied by a k1 factor, which is higher than the unit for temperatures lower than 40 °C, and lower than the unit if the ambient temperature is higher than 40 °C:

$$I_z = I_0 \cdot Kt$$

Where:

- **I<sub>0</sub>** is the current that the busbar trunking system can carry for an indefinite time at its reference temperature (40 °C)
- **Kt** is the correction coefficient for ambient temperature values other than the reference temperature, as shown in the following table

KT CORRECTION COEFFICIENT FOR AMBIENT TEMPERATURE													
<b>XCP-S</b>													
Ambient temperature [°C]	10	15	20	25	30	35	40	45	50	55	60	65	70
kt thermal correction factor [.]	1.15	1.12	1.09	1.06	1.03	1	0.97	0.93	0.90	0.87	0.83	0.79	0.76
<b>XCP-HP (Al)</b>													
Ambient temperature [°C]	10	15	20	25	30	35	40	45	50	55	60	65	70
kt thermal correction factor [.]	1.28	1.25	1.21	1.18	1.15	1.11	1.07	1.04	1	0.96	0.92	0.88	0.84
<b>XCP-HP (Cu)</b>													
Ambient temperature [°C]	10	15	20	25	30	35	40	45	50	55	60	65	70
kt thermal correction factor [.]	1.33	1.30	1.26	1.23	1.19	1.16	1.12	1.08	1.04	1	0.96	0.92	0.87

To select other system trunking paths (not just the main units at the transformer output), you need to consider and calculate the parameters on the following pages.

## Joule effect losses in busbars

### Technical Information

Losses due to the Joule effect are essentially caused by the electrical resistance of the busbar. Lost energy is transformed into heat and contributes to the heating of the conduit of the environment. The calculation of power loss is a useful data for correct sizing of the building air conditioning system.

Three-phase regime losses are:

$$P_j = \frac{3 \cdot R_t \cdot I_b^2 \cdot L}{1000}$$

In one-phase regime:

$$P_j = \frac{2 \cdot R_t \cdot I_b^2 \cdot L}{1000}$$

Where:

$I_b$  = Utilisation current (A)

$R_t$  = Phase resistance for unit of length of the busbar trunking system, measured at thermal regime (mΩ/m)

$L$  = Busbar length (m)

For accurate calculation, losses must be assessed trunk by trunk taking into account the transiting currents; for example, in the case of the distribution of the loads represented in the figure one has:

	Length	Transiting current	Losses
1st trunk	L1	$I_1+I_2+I_3$	$P_1 = 3R_t L_1 (I_1+I_2+I_3)^2$
2nd trunk	L2-L1	$I_2+I_3$	$P_2 = 3R_t (L_2-L_1) (I_2+I_3)^2$
3rd trunk	L3-L2	$I_3$	$P_3 = 3R_t (L_3-L_2) (I_3)^2$

Total losses in the busbar trunking system  $P_t = P_1+P_2+P_3$

### Losses based on the installation method

Thermal dispersion, rating and IP protection degree are independent from the type of installation (edgewise, flat, vertical)

This means that it is possible to install the XCP busbar trunking system as preferred, without having to consider a possible system downgrading.

Edgewise element

Flat element

## Selection of the busbar trunking system based on voltage drop

### Technical Information

If the line is particularly long (> 100 m), it will be necessary to check the value of the voltage drop. For systems with power factor (cosφm) not lower than 0.8 the voltage loss can be calculated using the following formulas:

#### THREE PHASE SYSTEM

$$\Delta v = \frac{b \cdot \sqrt{3} \cdot I_b \cdot L \cdot (R_t \cdot \cos\varphi_m + x \cdot \sin\varphi_m)}{1000}$$

#### ONE-PHASE SYSTEMS

$$\Delta v = \frac{b \cdot 2 \cdot I_b \cdot L \cdot (R_t \cdot \cos\varphi_m + x \cdot \sin\varphi_m)}{1000}$$

The percentage voltage drop can be obtained from:

$$\Delta v\% = \frac{\Delta v}{V_r} \cdot 100$$

Where Vr is the system rated voltage

In order to limit the voltage drop in case of very long busbar trunking systems, it is possible to allow for a power supply at an intermediate position, rather than at the terminal point.

### Calculation of the voltage drop with loads not evenly distributed

In case the load cannot be considered evenly distributed, the voltage drop may be determined more accurately using the relationships shown below.

For the distribution of three-phase loads, the voltage drop can be calculated using the following formula, on the assumption (generally verified) that the section of the busbar trunking system is consistent:

$$\Delta v = \sqrt{3} [R_t (I_{1L1} \cos\varphi_1 + I_{2L2} \cos\varphi_2 + I_{3L3} \cos\varphi_3) + x (I_{1L1} \sin\varphi_1 + I_{2L2} \sin\varphi_2 + I_{3L3} \sin\varphi_3)]$$

In general terms this becomes:

$$\Delta v = \frac{\sqrt{3} (R_t \cdot \sum I_i \cdot L_i \cdot \cos\varphi_{mi} + x \cdot \sum I_i \cdot L_i \cdot \sin\varphi_{mi})}{1000}$$

If the three-phase system and the power factor are not lower than cosφ = 0.7, the voltage loss may be calculated using the voltage drop coefficient shown in Table 1.

$$\Delta v\% = 2b \cdot \frac{k \cdot I_b \cdot L}{V_n} \cdot 100$$

The current distribution factor "b" depends on how the circuit is fed and on the distribution of the electric loads along the busbar:

Table 1 - The distribution factor of the current "b"

<b>b = 1</b>	Supplies at one end and load at the end of the line	
<b>b = 1/2</b>	Supplies at one end and with load evenly distributed	
<b>b = 1/4</b>	Supplies at both ends and with load evenly distributed	
<b>b = 1/4</b>	Central supply with loads at both ends	
<b>b = 1/8</b>	Central supply with load distributed evenly	

Example: XCP 2000A AI for riser mains feed

**I<sub>b</sub>** = 1600A operating current  
**b** = 1/2 load evenly distributed  
**k** = 27.3 see technical data table (XCP 2000 A AI cosφ = 0.85)  
**cosφ** = 0.85  
**L** = 100 m line length  
**V<sub>n</sub>** = 400 V operating voltage

$$\Delta v\% = \frac{27.3 \cdot 10^6 \cdot 1600 \cdot 100}{400} \cdot 100 = 10.9\%$$

#### Legend:

**I<sub>b</sub>** = the current that supplies the busbar [A]  
**V<sub>n</sub>** = the voltage power supply of the busbar [V]  
**L** = the length of the busbar [m]  
**Δv%** = the voltage drop percentage  
**b** = the distribution factor of the current  
**k** = corresponding voltage drop factor a cosφ [V/m/A] (see technical data table)  
**cosφ m** = Average power factor of the loads  
**x** = phase reactance by unit of length of the busbar (mΩ/m)  
**R<sub>t</sub>** = phase resistance by unit of length of the busbar (mΩ/m)  
**cosφ mi** = i-th load average power factor  
**I<sub>i</sub>** = i-th load current (A)  
**L<sub>i</sub>** = distance of the i-th load from the origin of the busbar trunking system

## Short circuit withstand

### Technical Information

The CEI 64-8 standard indicates that, for the protection of the circuits of the system, it is necessary to allow for devices aimed at interrupting short circuit currents before these become dangerous due to the thermal and mechanical effects generated in the conductors and the connections. In order to size the electric system and the protection devices correctly, it is necessary to know the value of the estimated short circuit current at the point where this is to be created. This value enables in fact to correctly select protection devices based on their own tripping and closing powers, and to check the resistance to electro-dynamic stress of the busbar supports installed in control panels, or/and of the busbar trunking systems.

### Characterisation of short circuit current

The estimated short circuit current at a point of the user system is the current that would occur if in the considered point a connection of negligible resistance was created between conductors under voltage. The magnitude of this current is an estimated value that represents the worst possible condition (null fault impedance, tripping time long enough to enable the current to reach the maximum theoretical values). In reality, the short circuit always occurs with significantly lower effective current values.

The intensity of the estimated short circuit current essentially depends on the following factors:

- Power of the cabin Transformer, meaning that the higher is the power, the higher is the current;
- length of the line upstream

In three-phase circuits with Neutral it is possible to have three different types of short circuit:

- phase-phase;
- phase-Neutral;
- balanced three-phase (most demanding condition)

The formula for the calculation of the symmetric component is:

$$\overline{i_{cc}} = \frac{\overline{E}}{Z_E + Z_L}$$

Where:

- **E** is the phase voltage;
- **Z<sub>E</sub>** is the secondary equivalent impedance of the TRANSFORMER measured between the phase and the Neutral;
- **Z<sub>L</sub>** is the impedance of the phase conductor only

## Short circuit withstand (continued)

### Analytical determination of short circuit currents

In order to calculate the value of the estimated short circuit current at any point of the circuit, it is sufficient to apply the formulas shown below, knowing the impedance calculated at the origin of the system up to the point being assessed. In the formulas shown below, the value of the short circuit power is considered infinite and the short circuit impedance is equal to 0. This makes it possible to define short circuit current values higher than the actual ones, but generally acceptable.

Line resistance $RL = r \cdot L$	<b>RL</b> = resistance of the line upstream (m) <b>r</b> = specific line resistance (m/m) <b>L</b> = upstream line length (m)
Line reactance $XL = x \cdot L$	<b>XL</b> = upstream line reactance (m) <b>x</b> = specific line reactance (m/m)
TRANSFORMER resistance $RE = \frac{1000 P_{cu}}{3I_n^2}$	<b>RE</b> = transformer secondary equivalent resistance (m) <b>P<sub>cu</sub></b> = transformer COPPER losses (W) <b>I<sub>n</sub></b> = transformer Rated current (A)
TRANSFORMER impedance $ZE = \frac{V_{cc}\% V^2c}{100 P}$	<b>ZE</b> = transformer secondary equivalent impedance (m) <b>V<sub>c</sub></b> = phase voltage (V) <b>V<sub>cc</sub>%</b> = percentage short circuit voltage <b>P</b> = transformer power (kVA)
TRANSFORMER reactance $XE = \sqrt{ZE^2 - RE^2}$	<b>XE</b> = transformer secondary equivalent reactance (m)
Short circuit impedance $Z_{cc} = \sqrt{(RL + RE)^2 + (XL + XE)^2}$	<b>Z<sub>cc</sub></b> = total short circuit impedance (m)
Estimated short circuit current $I_{cc} = \frac{V_{cc}}{\sqrt{3} \cdot Z_{cc}}$	<b>I<sub>cc</sub></b> = symmetric component of the short circuit current (kA)

## Harmonics

### Technical Information

In a distribution system, currents and voltages should have a perfectly sinusoidal shape. However, in practice the equipment contains electric devices such as changeover devices or dimmers that make the load non linear.

The currents absorbed, although at regular intervals and with frequencies equal to that of the rated voltage, sometime have a non-sinusoidal wave form, which has the following negative effects:

- worsening of the power factor;
- heating of the Neutral;
- additional losses in electric machinery (transformers and motors);
- instable operation of the protection elements (thermal magnetic and earth leakage circuit breakers)

In industrial plants these conditions have been occurring for a long time, However, they are now occurring more and more in service sector distribution systems, where, from backbone distribution (which uses three-phase lines), one-phase loads are often distributed, which contributes to increasing the unbalance of the electric system.

Each type of non-sinusoidal periodical wave may be split into a more or less large number of sinusoids (called harmonic components), which frequency a whole multiple of the frequency of the wave shape observed.

A deformed current at a frequency of 50 Hz, like for example that represented by the red line on the figure, consists of many sinusoidal currents with frequency of 50 Hz (fundamental), 100 Hz (second harmonic components), 150 Hz (third harmonics), and so on.

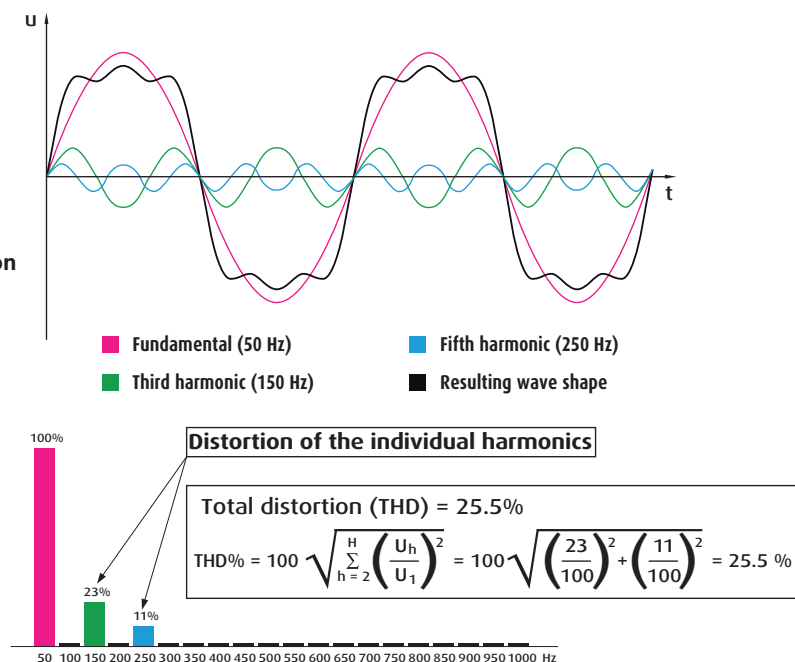

The presence of current harmonics represents an important problem, causing overload conditions both on phase conductors, and on any Neutral conductor, and results in the reduction of the conductor permitted load.

### Choice of the rating when in the presence of harmonics

When in the presence of harmonics, and when using the chosen Int rated current, the XCP busbar to be used shall have the rating specified in the table by side.

Rated current	630 A	800 A	1000 A	1250 A	1600 A	2000 A	2500 A	3200 A	4000 A	5000 A
XCP busbar to be used:										
THD ≤ 15%	630 A	800 A	1000 A	1250 A	1600 A	2000 A	2500 A	3200 A	4000 A	5000 A
15% < THD ≤ 33%	800 A	1000 A	1250 A	1600 A	2000 A	2500 A	3200 A	4000 A	5000 A	—
THD > 33%	1000 A	1250 A	1600 A	2000 A	2500 A	3200 A	4000 A	5000 A	—	—

Measurement of harmonic distortion carried out with a network analyser

A solution to guarantee protection against overloads due to the presence of harmonics, is the choice of XCP busbars equipped with double neutral

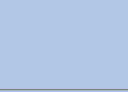

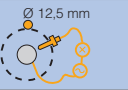

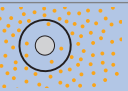

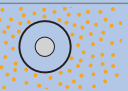

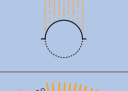

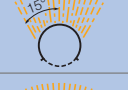

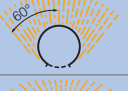

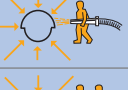

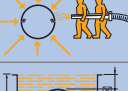

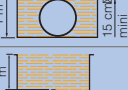

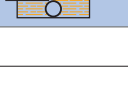

## Degrees of protection

### IP: degree of protection provided against intrusion

#### IP

The protection enclosures are classified (IEC 60529) in according to their degree of protection against weather conditions and external agents. The degree of protection is indicated by two digits (protection against solid bodies and liquids) following the symbol IP.

To increase the ease of choice of the most suitable busbar, in according to installation requirements, below there is a summary of their performance, based on the IP degree of protection according to the IEC 60529 standard.

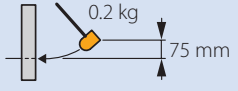

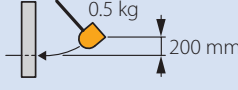

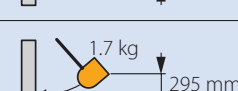

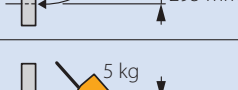

1 <sup>st</sup> digit IP	
Protection against penetration of solid bodies	
	<b>0</b> No protection
	<b>1</b> Protection against solid bodies larger than 50 mm (e.g.: accidental contact)
	<b>2</b> Protection against solid bodies larger than 12 mm (e.g.: finger)
	<b>3</b> Protection against solid bodies larger than 2.5 mm
	<b>4</b> Protection against solid bodies larger than 1 mm
	<b>5</b> Protection against dust
	<b>6</b> Complete protection against dust
2 <sup>nd</sup> digit IP	
Protection against penetration of liquids	
	<b>0</b> No protection
	<b>1</b> Protection against vertically-falling drops of water (condensation)
	<b>2</b> Protection against drops of water falling up to 15° from the vertical
	<b>3</b> Protection against drops of water up to 60° from the vertical
	<b>4</b> Protection against sprays of water from all directions
	<b>5</b> Protection against jets of water from all directions
	<b>6</b> Protection against jets of water (similar force to heavy seas)
	<b>7</b> Protection against the effects of immersion
	<b>8</b> Protection against effects of immersion under pressure

## Degrees of protection

### IK: degree of protection of equipment to mechanical impact

#### IK

Standard IEC 62262 defines an IK code that characterises the aptitude of equipment to resist mechanical impacts on all sides.

IK	Test	Impact energy (In joules)
IK 00		0
IK 01		0.15
IK 02		0.2
IK 03		0.35
IK 04		0.5
IK 05		0.7
IK 06		1
IK 07		2
IK 08		5
IK 09		10
IK 10		20

# XCP-S

Busbar from 630 to 6300 A

The light and compact power solution for standard applications.

XCP-S is an extra compact and light busbar trunking system. It is the range used for transport and distribution of High Power, and is also highly valued in rising mains.

# STRAIGHT ELEMENTS

## Technical Information

64280100P

### XCP-S Line:

Reference standard: IEC 61439-6. Reference temperature: 35 °C.  
 Protection degree: IP55. Thickness of metal sheet: 1.5 mm.  
 N° of conductors: 3, 4 or 5. Painted: RAL 7035. Halogen Free.  
 The insulation between bars is ensured by a double sheet made with polyester film class B(130°C), class F (155°C) thermal resistance available on request. All plastic components have a V1 self-extinguishing degree (as per UL94); they are fire retardant and comply with the glow-wire test according to standards.

## Dimensions

### Straight elements for distribution

- Straight elements for plug-in type tap-off boxes
- Standard 3000 mm
- Tap-off outlets on both sides

These straight elements enable the application of plug-in boxes on dedicated outlets. Available in lengths from 1 to 3 meters, these elements have respectively 1, 2 and 3 outlets at preset distances with centre distances of 850 mm on both side.

(\*) The exception to these are 630-800 A elements with Aluminium conductors (Al) and 800-1000 A elements with Copper conductors (Cu), where distributions are only available on the top side (in standard execution) for example "3+0".

On request, the length of the elements and the number and position of distribution outlets may be different from the standards measures.

### MIN AND MAX DIMENSIONS OF SINGLE AND DOUBLE BAR

Aluminium (Al)	630A - 5000A
Copper (Cu)	800A - 6300A
(L) min/MAX [mm]	1001 ***/3000

(\*\*\*) For the length from 1001 mm to 1250 mm is possible to install only plug-in boxes Type 1 and 3. From 1250 mm to 3000 mm is possible to install all types of plug-in boxes. Compatible boxes are listed in dedicated chapter. See page 89.

(\*\*) at request is possible to have others combinations of outlets:  
 length: 1501÷2000 - outlets: (1+1)  
 length: 2001÷2500 - outlets: (1+1)  
 length: 2501÷2999 - outlets: (1+1) and (2+2)  
 length: 3000 - outlets: (1+1) and (2+2)  
 Possibility to have outlets in special position

For a correct evaluation of the number of outlets, take into account the length of the element and the size of the boxes to be installed.

## Fire barrier elements S120 EI120 (EN 1366-3)

When the busbar trunking system crosses fire resistant walls or ceilings, it must be fitted with appropriate fire barriers. The fire barrier is 630 mm (Al) and 1000 mm (Cu) long and must always be positioned in the middle of the fire resistant wall or ceiling crossed by the busbar. After crossing fire resistant walls or ceilings, any cavity must be sealed with material meeting current regulations for the required building fire resistance class.

Item	Al	Cu	In (A)	Type

673EFB03	673EFB52	673EFB52	3200	
673EFB04	673EFB53	673EFB53	4000	
673EFB05	673EFB54	673EFB54	5000	
-	673EFB55	673EFB55	6300	

\*Inside these busbar there is no air gaps and so there is no need to add internal fire barriers.

## Dimensions

### Fire barrier elements EI120 (EN 1366-3)

**Fire barrier sizes**  
Dimension H changes with the rating; it is specified in the technical information

For some ratings it is necessary to fit at the factory an internal fire barrier following the indications on the table. It is therefore necessary to indicate at the order stage what elements will cross fire resistant walls or ceilings.

Figure 1 minimum straight dimensions

Figure 2 minimum dimensions in an elbow

USE OF INTERNAL OR EXTERNAL BARRIER					
In (A)	Al		In (A)	Cu	
	Internal	External		Internal	External
630-800	✓	✓	800-1000	✓	✓
1000-2000	-	✓	1250-2000	-	✓
2500-4000	✓	✓	2500-5000	✓	✓
5000	-	✓	6300	-	✓

The external fire barrier can be used on any trunking component in compliance with the operating instructions specified in figures 1 and 2

To be comply to the Certification of Fire resistance it's necessary to install both internal\* and external fire barrier supplied by Legrand.

\* Internal barrier in few ratings is not required

# STRAIGHT ELEMENTS

64280200P

## Expansion element

Due to being subjected to temperature changes, both the busbar and the building suffer thermal expansions. The expansion element can absorb expansion and contraction of both the busbar trunking system section and the building, up to the maximum permitted length ( $\pm 50$  mm approx.). The expansion element must be fitted near the expansion joints of the building and in straight sections of the line (horizontal and/or vertical) longer than 40 m. For straight line sections longer than 40 m, expansion elements must be fitted in a way that splits the path into equal sections not longer than 40 m. XCP-S busbar trunking system elements are designed to compensate for thermal expansion if the straight sections of the installation are less than 40 m; in this case no expansion element is necessary.

Item	Al	Cu	In (A)	Length
64280200P		-	630	1.5 m

-		67390209P	6300	

## Dimensions

### Expansion element

Dimension H changes with the ratings and it is specified in the Technical information

**Example:** Straight section length 70 m = n°1 expansion element in the center of the line

**Example:** Straight section length 120 m = n°2 expansion elements, one every 40 m

**Example:** Straight section length 170 m = n° 4 expansion elements, one every 34 m

**Example:** Section length 70 m. When the section is not straight, no expansion element is necessary

# STRAIGHT ELEMENTS

Item		Phase balancing	
Al	Cu	In (A)	
64287100P	-	630	Straight elements with phase balancing are used to reduce and balance mutual phase reactance and impedance in case of long lines. In particularly long sections (> 100 metres) it is recommended that two transposition elements are fitted (one at one third and one at two thirds of the path), to balance the system electric impedance: In this way, it will be possible to have along the installation path all the possible combination, of reciprocal positions among phases, minimising load losses (Fig.1). If it's necessary to have the same phase sequence at the start and the end, use 3 phase balancing elements (fig.2).

## Dimensions

### Phase balancing 1200 mm

In particularly long carrying sections (L> 100 meters) it is recommended to insert 2 elements always by 2: (one placed at 1/3 and one placed at 2/3 of the trunking path) to balance the electric impedance of the system. "L" is the total length of the path.

For example, in a line exceeding 300 m it is recommended that one phase transposition is fitted at 100 m, and another one at 200 m.

### Phase Inversion 1200 mm

### Element with neutral rotation 1000 mm

When the position of neutral of the distribution board phases is different from that of the transformer, it is possible to use an element that allows a neutral rotation only.

**Warning:** Use phase inversion and neutral rotation elements ONLY for transport paths, and not for derivations (not use it when the line includes straight elements with derivations, or when they are provided for tap-off boxes even if bolted on the junction)  
The position of all the conductors, including the neutral, changes, and may cause serious problems on a connected load, if one is not fully aware that the phase sequence and the position of the neutral DO NOT comply with those indicated in the pre-printed labels.

# FEED UNIT

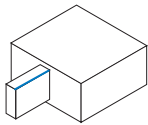

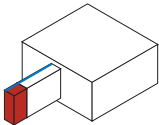

64281106P

The feed units are used at the end of the lines, when the busbar must be powered using cables. They are available in the right (without Monobloc) and left (with Monobloc fitted) version. On request they are available with non-standard execution. End feed units for single bar busbars are supplied with an aluminium blind back closing plate. For double bar busbar trunking systems the plates are 2.

Both versions are fitted with 2 extra side steel flanges and 2 inspection steel flanges (dark grey colour). The cable is connected directly to the busbars using bolts. For more information on board/busbar connection see the tables (Dimensions For The Box).

To feed the power supply cable through the back power supply flanges it will be necessary to drill a hole in case of single bar and two holes in case of double bar. The size of the holes is 170 x 410 mm.

# RISING MAINS FEED UNIT

67281133P

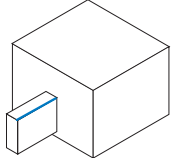

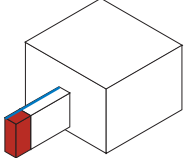

The rising mains feed units are used at the departure of the riser mains lines, when the busbar must be placed close to the wall and powered using cables. They are available in the right (without Monobloc) and left (with Monobloc fitted) versions, and they allow the busbar to be installed 40 mm away from the wall. On request they are available with non-standard execution. End feed units for single bar busbars are supplied with an aluminium blind back closing plate. For double bar busbar trunking systems the plates are 2. Both versions are fitted with 2 extra side steel flanges and 2 inspection steel flanges (dark grey colour). The cable is connected directly to the busbars using bolts. For more information on board/busbar connection see the tables below (Dimensions For The Box). To feed the power supply cable through the back power supply flanges it will be necessary to drill a hole in case of single bar and two holes in case of double bar. The size of the holes is 170 x 410 mm.

## Dimensions

### Horizontal elbow

In order to define the type of horizontal elbow required, consider to place the element "edgewise" (conductors perpendicular to the ground). In this configuration "horizontal" elbows enable a path variation parallel to the ground. When the neutral busbar conductor faces the outside of the elbow, there will be a Right horizontal elbow (type 1). Contrariwise, with the neutral busbar conductor facing the inside of the elbow there will be a Left horizontal elbow (type 2).

The dimensions are referred to the standard elements.  
Single/double/triple bar (A+B):  
300+300 mm

## Dimensions

### Vertical elbow

In order to define the type of vertical elbow, it is necessary to still place the element "edgewise" (conductors perpendicular to the ground), with the section with Monobloc facing the observer and the section without facing up. In this configuration, vertical "elbows" enable an up or down facing variation. If the neutral is on the left side, there will be a left vertical elbow (Type 1). If, on the other side, it is on the right side, there will be a right vertical elbow (Type 2).

MIN AND MAX DIMENSIONS

A	340/1449*
B	340/1449*
Triple bar min/MAX	
A	485/1199*
B	485/1199*

Dimension H changes with the rating; it is specified in the technical information

The dimensions are referred to the standard elements.

Single bar (A+B) : 300+300 mm  
 Double bar (A+B) : 450+450 mm  
 Triple bar (A+B) : 500+500 mm

No standard elements "Special" (with measurements that are different from those show in the figure) are referred to the Min and Max dimensions specified in the table.

\* For all the non standard vertical elbows (special), it is possible to have only one of the two sides in size exceeding 600 mm. For example, when ordering a vertical elbow with size A=1000 mm, the B size will have to be ≤ 600 mm

### How to measure vertical angles

To calculate the measurements of vertical elbows, consider the center-to-center distance as shown in the drawings.

## Dimensions

### Double horizontal elbow

Double horizontal elbows are the union of two horizontal elbows; in order to define the type, it is enough to observe them starting from the Monobloc; if the first elbow met is left, we will have a double horizontal elbow left + right (Type 2). Contrariwise, if the first elbow met is right, we will have a double horizontal elbow right + left (Type 1).

# TECHNICAL INFORMATION

## General features

XCP-S line is available in the standard range:

From **630A to 5000A with aluminum alloy** conductors and **from 800A to 6300A with copper** conductors.

The compact dimensions of the XCP-S enhance **its resistance to short circuit stresses**; in addition, they can reduce the impedance of the circuit by controlling the voltage drops and allow for the installation of high power electrical systems, even in extremely confined spaces.

XCP-S is available with **a wide selection of tap-off boxes that range from 63A up to 1250A**, thus allowing you to locally protect and feed different types of loads by housing protective devices such as fuses, MCCBs and motorised switches.

XCP-S is not only in **compliance with the harmonised Standards CEI EN 61439-6** but also answers specifically to many clients needs for more severe conditions of use.

Thus **the rated current** of Starline's busbar trunking system is **always referred to the average ambient temperature of 35 °C**

The nominal range of all XCP-S is guaranteed both for horizontal installations (flat and edgewise) and for vertical installations without derating.

XCP-S busbar trunking systems are designed so that they can be **maintenance-free**, except for the periodic and compulsory inspections required by the Standard IEC 60364

The tightening torque inspection of the junction can be carried out by qualified personnel, even when the busbar is energized.

## Structural features

The outer casing of the XCP-S line consists of four C-ribbed section bars, bordered and riveted (thickness 1.5mm), **with excellent mechanical, electric and heat loss efficiency. The sheetmetal is made of galvanized steel**, treated according to UNI EN10327 and **coated with RAL7035 resins with a high resistance to chemical agents**. **The standard degree of protection is IP55, on request IP65 (only for transport of energy)**; with certain accessories, it can also be installed outdoors.

The busbar conductors have a rectangular cross section with rounded corners; there are two versions:

- **Electrolytic copper ETP 99.9 UNI EN13601**
- **Aluminum alloy** treated over the entire surface with **5 galvanic processes** (copper plating + tin plating)

The insulation between bars is ensured by a **double sheath made with polyester film** (total thickness 2x0.19 mm) **class B (130°C)**, (total thickness 2x0.23 mm) **class F (155°C)** thermal resistance available on request. All plastic components have a **V1 self-extinguishing degree**; they are fire retardant and comply with the glow-wire test according to standards.

The XCP-S line is **Halogen Free**. In order to facilitate storage operations especially to reduce the installation time, the straight elements, trunking **components** as well as all the components of the XCP-S line are **supplied with a monobloc pre-installed at the factory**. The junction contact is ensured by **tin plated aluminium for XCP-S Al and copper for XCP-S Cu for each phase**, insulated with red **class F thermosetting plastic material**.

The **monobloc** has **shearhead bolts**: after tightening the nuts with a standard wrench, the outer head will break at the correct torque value, hence giving you the certainty that the connection has been made properly so as to guarantee safety and maximum performance over time.

Finally, in order to completely verify the insulation level, every finished product undergoes an **insulation test** (phase-phase, phase-PE) at the factory with a test voltage of 3500 Vac for 1.5 seconds. The test is performed on the finished product, completely assembled. IP55 and IP65 is intended for internal use only, for outdoor applications is needed a canopy designed by us or RCP resin IP68 busbar.

# XCP-HP

Busbar from 630 to 6300 A

The High Performance power solution  
for data center applications

**XCP-HP** is a busbar trunking system characterized by high performance and low losses due to the joule effect. Used for transport and distribution of High Power, and is also highly valued in rising mains.

# STRAIGHT ELEMENTS

63280100P

**XCP-HP Line:**

Reference standard: IEC 61439-6. Reference temperature: up to 55 °C.  
 Protection degree: IP55. Thickness of metal sheet: 1.5 mm.  
 N° of conductors: 3, 4 or 5. Painted: RAL 7035. Halogen Free.  
 The insulation between bars is ensured by a double sheet made with polyester film class B(130°C), class F (155°C) thermal resistance available on request. All plastic components have a V1 self-extinguishing degree (as per UL94); they are fire retardant and comply with the glow-wire test according to standards.

### Straight elements

Standard 3000 mm

Dimension H changes with the ratings and it is specified in the Technical information

#### MIN AND MAX DIMENSIONS OF SINGLE AND DOUBLE BAR

Aluminium (Al)	630A - 5000A
Copper (Cu)	800A - 6300A
(L) min/MAX [mm]	500/3000

Straight elements are available on request only for transport of energy:  
 Al: 5000A  
 Cu: 6300A

**Notes**

The product versions in the whole catalogue will be simplified as shown opposite, highlighting the part with the monobloc installed in red and the neutral side in blue. In the whole catalogue, the measurements shown refer to the element centre distance

The range is also available on request in different versions: (5 Conductors with dedicated PE conductor, double neutral and more others...)

## Dimensions

### Straight elements for distribution

- Straight elements for plug-in type tap-off boxes
- Standard 3000 mm
- Tap-off outlets on both sides

These straight elements enable the application of plug-in boxes on dedicated outlets. Available in lengths from 1 to 3 meters, these elements have respectively 1, 2 and 3 outlets at preset distances with centre distances of 850 mm on both side.

(\*) The exception to these are 630-800 A elements with Aluminium conductors (Al) and 800-1000 A elements with Copper conductors (Cu), where distributions are only available on the top side (in standard execution) for example "3+0".

On request, the length of the elements and the number and position of distribution outlets may be different from the standards measures.

Dimension H changes with the ratings and it is specified in the Technical information

### MIN AND MAX DIMENSIONS OF SINGLE AND DOUBLE BAR

Aluminium (Al)	630A - 5000A
Copper (Cu)	800A - 6300A
(L) min/MAX [mm]	1001 ***/3000

(\*\*\*) For the length from 1000 mm to 1250 mm is possible to install only plug-in boxes Type 1 and 3. From 1250 mm to 3000 mm is possible to install all types of plug-in boxes. Compatible boxes are listed in dedicated chapter. See page 89.

(\*\*) at request is possible to have others combinations of outlets:  
 length: 1501÷2000 - outlets: (1+1)  
 length: 2001÷2500 - outlets: (1+1)  
 length: 2501÷2999 - outlets: (1+1) and (2+2)  
 length: 3000 - outlets: (1+1) and (2+2)  
 Possibility to have outlets in special position

# STRAIGHT ELEMENTS

673IFB01

Item		Fire barrier elements S120 EI120 (EN 1366-3)	
When the busbar trunking system crosses fire resistant walls or ceilings, it must be fitted with appropriate fire barriers. The fire barrier is 630 mm (Al) and 1000 mm (Cu) long and must always be positioned in the middle of the fire resistant wall or ceiling crossed by the busbar. After crossing fire resistant walls or ceilings, any cavity must be sealed with material meeting current regulations for the required building fire resistance class.

## Dimensions

### Fire barrier elements EI120 (EN 1366-3)

**Fire barrier sizes**  
Dimension H changes with the rating; it is specified in the technical information

For some ratings it is necessary to fit at the factory an internal fire barrier following the indications on the table. It is therefore necessary to indicate at the order stage what elements will cross fire resistant walls or ceilings

### Figure 1 minimum straight dimensions

### Figure 2 minimum dimensions in an elbow

### USE OF INTERNAL OR EXTERNAL BARRIER

In (A)	Al		In (A)	Cu	
	Internal	External		Internal	External
630-800	-	√	800	√	√
1000	√	√	1000-2500	-	√
1250	-	√	3200-5000	√	√
1600-4000	√	√	6300	-	√
5000	-	√			

The external fire barrier can be used on any trunking component in compliance with the operating instructions specified in figures 1 and 2

To be comply to the Certification of Fire resistance it's necessary to install both internal\* and external fire barrier supplied by Legrand.

\* Internal barrier in few ratings is not required

# STRAIGHT ELEMENTS

63280200P

Item		Expansion element	
Al	Cu	In (A)	Type
63280200P	-	630	A = 1.5 m
63280201P	66280200P	800	
63280202P	66280201P	1000	
63280204P	66280203P	1250	
63280206P	66280205P	1600	
63280207P	66280206P	2000	
63390204P	66280208P	2500	
63390206P	66390205P	3200	
63390207P	66390206P	4000	
63390208P	66390208P	5000	
-	66390209P	6300	

Due to being subjected to temperature changes, both the busbar and the building suffer thermal expansions. The expansion element can absorb expansion and contraction of both the busbar trunking system section and the building, up to the maximum permitted length ( $\pm 50$  mm approx.). The expansion element must be fitted near the expansion joints of the building and in straight sections of the line (horizontal and/or vertical) longer than 40 m. For straight line sections longer than 40 m, expansion elements must be fitted in a way that splits the path into equal sections not longer than 40 m. XCP-HP busbar trunking system elements are designed to compensate for thermal expansion if the straight sections of the installation are less than 40 m; in this case no expansion element is necessary.

## Dimensions

### Expansion element

Dimension H changes with the ratings and it is specified in the Technical information

**Example:**  
Straight section length 70 m = n°1 expansion element in the center of the line

**Example:**  
Straight section length 120 m = n°2 expansion elements, one every 40 m

**Example:**  
Straight section length 170 m = no. 4 expansion elements, one every 34 m

**Example:**  
Section length 70 m. When the section is not straight, no expansion element is necessary.

# STRAIGHT ELEMENTS

Item		Phase balancing	
Al	Cu	In (A)	
63287100P	-	630	Straight elements with phase balancing are used to reduce and balance mutual phase reactance and impedance in case of long lines. In particularly long sections (> 100 metres) it is recommended that two transposition elements are fitted (one at one third and one at two thirds of the path), to balance the system electric impedance: In this way, it will be possible to have along the installation path all the possible combination, of reciprocal positions among phases, minimising load losses (Fig.1). If it's necessary to have the same phase sequence at the start and the end, use 3 phase balancing elements (fig.2).
63287101P	66287100P	800	
63287102P	66287101P	1000

63397128P	66397128P	5000	
-	66397129P	6300	

Item		Element with Neutral rotation	
Al	Cu	In (A)	
63287140P	-	630	The straight element with Neutral rotation is used to adapt the sequence of the busbar phases to the sequence of the connections required at the ends of the connections, should these be different. In the connection between electric boards, the neutral jump is normally used, as only the neutral position is normally identified.
63287141P	66287140P	800	
63287142P	66287141P	1000

63397147P	66397146P	4000	
63397148P	66397148P	5000	
-	66397149P	6300	

## Dimensions

### Phase balancing 1200 mm

(fig. 1) Electric diagram: 2 elements offer all the possible reciprocal positions among the phases along the line.

(fig. 2) If it's necessary to have the same phase sequence at the start and the end, use 3 phase balancing elements.

In particularly long carrying sections (L > 100 meters) it is recommended to insert 2 elements always by 2: (one placed at 1/3 and one placed at 2/3 of the trunking path) to balance the electric impedance of the system. "L" is the total length of the path.

For example, in a line exceeding 300 m it is recommended that one phase transposition is fitted at 100 m, and another one at 200 m.

### Phase Inversion 1200 mm

### Element with neutral rotation 1000 mm

When the position of neutral of the distribution board phases is different from that of the transformer, it is possible to use an element that allows a neutral rotation only.

**Warning:** Use phase inversion and neutral rotation elements ONLY for transport paths, and not for derivations (not use it when the line includes straight elements with derivations, or when they are provided for tap-off boxes even if bolted on the junction) The position of all the conductors, including the neutral, changes, and may cause serious problems on a connected load, if one is not fully aware that the phase sequence and the position of the neutral DO NOT comply with those indicated in the pre-printed labels.

# FEED UNIT

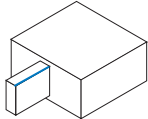

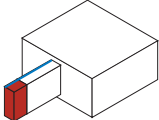

63281106P

The feed units are used at the end of the lines, when the busbar must be powered using cables. They are available in the right (without Monobloc) and left (with Monobloc fitted) version.

On request they are available with non-standard execution.

End feed units for single bar busbars are supplied with an aluminium blind back closing plate. For double bar busbar trunking systems the plates are 2. Both versions are fitted with 2 extra side steel flanges and 2 inspection steel flanges (dark grey colour). The cable is connected directly to the busbars using bolts.

For more information on board/busbar connection see the tables (Dimensions For The Box). To feed the power supply cable through the back power supply flanges it will be necessary to drill a hole in case of single bar and two holes in case of double bar. The size of the holes is 170 x 410 mm.

## Dimensions

### Horizontal elbow

In order to define the type of horizontal elbow required, consider to place the element "edgewise" (conductors perpendicular to the ground). In this configuration "horizontal" elbows enable a path variation parallel to the ground. When the neutral busbar conductor faces the outside of the elbow, there will be a Right horizontal elbow (type 1). Contrariwise, with the neutral busbar conductor facing the inside of the elbow there will be a Left horizontal elbow (type 2).

The dimensions are referred to the standard elements.  
Single/double/triple bar (A+B):  
300+300 mm

A	250/1299*
B	250/1299*
Triple bar min/MAX	
A	250/999*
B	250/999*

Dimension H changes with the rating; it is specified in the technical information

No standard elements "Special" (with measurements that are different from those show in the figure) are referred to the Min and Max dimensions specified in the table.

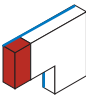

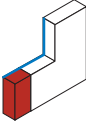

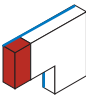

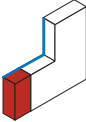

\* For all the non standard horizontal elbows (special), it is possible to have only one of the two sides in size exceeding 600 mm. For example, when ordering an horizontal elbow with size A=1000 mm, the B size will have to be ≤ 600 mm

## Dimensions

### Vertical elbow

In order to define the type of vertical elbow, it is necessary to still place the element "edgewise" (conductors perpendicular to the ground), with the section with Monobloc facing the observer and the section without facing up. In this configuration, vertical "elbows" enable an up or down facing variation. If the neutral is on the left side, there will be a left vertical elbow (Type 1). If, on the other side, it is on the right side, there will be a right vertical elbow (Type 2).

B	340/1449*
Triple bar min/MAX	
A	485/1199*
B	485/1199*

Dimension H changes with the rating; it is specified in the technical information

The dimensions are referred to the standard elements.  
 Single bar (A+B) : 300+300 mm  
 Double bar (A+B) : 450+450 mm  
 Triple bar (A+B) : 500+500 mm

No standard elements "Special" (with measurements that are different from those show in the figure) are referred to the Min and Max dimensions specified in the table.

\* For all the non standard vertical elbows (special), it is possible to have only one of the two sides in size exceeding 600 mm. For example, when ordering a vertical elbow with size A=1000 mm, the B size will have to be ≤ 600 mm

### How to measure vertical angles

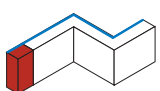

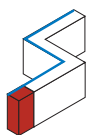

To calculate the measurements of vertical elbows, consider the center-to-center distance as shown in the drawings.

## Dimensions

### Double horizontal elbow

Double horizontal elbows are the union of two horizontal elbows; in order to define the type, it is enough to observe them starting from the Monobloc; if the first elbow met is left, we will have a double horizontal elbow left + right (Type 2). Contrariwise, if the first elbow met is right, we will have a double horizontal elbow right + left (Type 1).

## Dimensions

### Double elbow horizontal + vertical

Double elbows horizontal + vertical are the union of a horizontal and a vertical elbow, placed in succession starting from the side with Monobloc.

Depending on the type of elbows, the double horizontal + vertical elbow may be of four different types:

- Double elbow Horizontal RH + Vertical RH (Type 1)
- Double elbow Horizontal RH + Vertical LH (Type 2)
- Double elbow Horizontal LH + Vertical RH (Type 3)
- Double elbow Horizontal LH + Vertical LH (Type 4)

## Dimensions

### Double elbow vertical + horizontal

Double elbows vertical + horizontal are the union of a vertical and a horizontal elbow, placed in succession starting from the side with Monobloc.

Depending on the type of elbows, the double vertical + horizontal elbow may be of four different types:

- Double elbow vertical RH + horizontal RH (Type 1)
- Double elbow vertical RH + horizontal LH (Type 2)
- Double elbow vertical LH + horizontal RH (Type 3)
- Double elbow vertical LH + horizontal LH (Type 4)

### MIN AND MAX DIMENSIONS

#### Single bar min/MAX

A	250/1299*
B	150/599*
C	250/1299*

#### Double bar min/MAX

A	340/1449*
B	325/899*
C	250/1299*

#### Triple bar min/MAX

A	485/1199*
B	380/799*
C	250/999*

Dimension H changes with the rating; it is specified in the technical information

The dimensions are referred to the standard elements.  
Single bar (A+B+C): 300+300+300 mm  
Double bar (A+B+C): 450+450+300 mm  
Triple bar (A+B+C): 500+500+300 mm

No standard elements "Special" (with measurements that are different from those show in the figure) are referred to the Min and Max dimensions specified in the table.

\* Warning: for safety reasons on production and also to help installation phases, when one dimension (ie: A=1100) need to be pulled close to his maximum excursion, the other two dimensions should be maintained close to the standard dimension (i.e.: B=300; C=310).

# TECHNICAL INFORMATION

## General features

XCP-HP line is available in the standard range:  
 From **630A to 5000A with aluminum alloy** conductors and **from 800A to 6300A with copper conductors**

The compact dimensions of the XCP-HP enhance **its resistance to short circuit stresses**; in addition, they can reduce the impedance of the circuit by controlling the voltage drops and allow for the installation of high power electrical systems, even in extremely confined spaces. XCP-HP is available with **a wide selection of tap-off boxes that range from 63A up to 1250A**, thus allowing you to locally protect and feed different types of loads by housing protective devices such as fuses, MCCBs and motorised switches

XCP-HP is not only in **compliance with the harmonised Standards CEI EN 61439-6** but also answers specifically to many clients needs for more severe conditions of use

Thus **the rated current** of Starline's busbar trunking systems is **always referred to the average ambient temperature of up to 55 °C**. The nominal range of all XCP-HP is guaranteed both for horizontal installations (flat and edgewise) and for vertical installations without derating.

XCP-HP busbar trunking systems are designed so that they can be **maintenance-free**, except for the periodic and compulsory inspections required by the Standard IEC 60364

The tightening torque inspection of the junction can be carried out by qualified personnel, even when the busbar is energized.

## Structural features

The outer casing of the XCP-HP line consists of four C-ribbed section bars, bordered and riveted (thickness 1.5mm), **with excellent mechanical, electric and heat loss efficiency. The sheetmetal is made of galvanized steel**, treated according to UNI EN10327 and **painted with RAL7035 resins with a high resistance to chemical agents**. **The standard degree of protection is IP55, on request IP65 (only for transport of energy)**; with certain accessories, it can also be installed outdoors.

The busbar conductors have a rectangular cross section with rounded corners; there are two versions:

- **Electrolytic copper ETP 99.9 UNI EN13601**
- **Aluminum alloy** treated over the entire surface with **5 galvanic processes** (copper plating + tin plating)

The insulation between bars is ensured by a **double sheath made with polyester film** (total thickness 2x0.19 mm) **class B (130°C)**, (total thickness 2x0.23 mm) **class F (155°C)** thermal resistance available on request. All plastic components have a **V1 self-extinguishing degree**; they are fire retardant and comply with the glow-wire test according to standards. The XCP-HP line is **Halogen Free**. In order to facilitate storage operations especially to reduce the installation time, the straight elements, trunking **components** as well as all the components of the XCP-HP line are **supplied with a monobloc pre-installed at the factory**. The junction contact is ensured by **tin plated aluminium for XCP-HP Al and copper for XCP-HP Cu** for each phase, insulated with red **class F thermosetting plastic material**.

The **monobloc** has **shearhead bolts**: after tightening the nuts with a standard wrench, the outer head will break at the correct torque value, hence giving you the certainty that the connection has been made properly so as to guarantee safety and maximum performance over time.

Finally, in order to completely verify the insulation level, every finished product undergoes an **insulation test** (phase-phase, phase-PE) at the factory with a test voltage of 3500 Vac for 1.5 seconds. The test is performed on the finished product, completely assembled. IP55 and IP65 is intended for internal use only, for outdoor applications is needed a canopy designed by us or RCP resin IP68 busbar.

 \*\* Class F available under request

Over 55°C it will be necessary to derate the busbar and for ambient temperatures under -5°C contact the technical support.

The data on this page refer to the 50 Hz frequency. For 60 Hz, please contact Starline.

# ACCESSORIES

## Universal Accessories

### Suitable for both XCP-S and XCP-HP

A range of accessories common to both product lines, allow you to complete and customise the path of busbar, according to the design requirements.

Connection interfaces with exit bars + elbow

Connection interfaces with exit bars + double elbow

**Note:** for more information about the accessories on this page, please contact Starline.

# BRACKETS

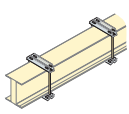

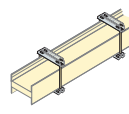

65202001

The brackets enable sturdy installation of the busbar to the system support structures. The recommended installation distance between brackets is 1.5 metres. Starline offers suitable bracket solutions certified for any type of installation, even in the most difficult environments:

- installations subjected to strong vibrations;
- installation in seismic environments

# FIXING INDICATION - BRACKETS

## Technical information

For vertical path sections of less than 2 m the use of standard suspension brackets is sufficient.

### 1- Horizontal installation fixing

Fixing recommended: 1 bracket every 1.5 metres.

### 2- Fixing for vertical installation (rising mains)

In case of rising mains, in addition to the standard brackets it will also be necessary to use other screw fixed brackets to prevent sliding of the busbar. Thanks to pre-loaded springs, these brackets absorb the forces pressing on the busbar and direct any expansion in a precise direction. They therefore operate as a limitation, and support the traction and compression forces of the busbar trunking system.

#### - Section line between 2 and 4 m

In the lowest point **Type B** vertical bracket if secured **to the wall**, or **Type D** if secured **to the floor** + one edgewise installation **standard bracket**

#### - Section line of over 4 m

In the lowest point **Type A** vertical bracket if secured **to the wall**, or **Type C** if secured **to the floor** + one edgewise installation **standard bracket** every metre and a half of the path + one **Type A or C** bracket based on the tables on the following page.

### 3- Fixing for installation in seismic environments in horizontal

Fit 1 bracket every metre and a half of the busbar. Every 2 anti-seismic brackets with bracket (Type B), use one standard bracket.

### 4- Fixing for installation in seismic environments in vertical (section lengths > 2 m)

Fit 1 bracket every metre and a half of the busbar. Every 2 anti-seismic brackets with bracket (Type B) use one bracket with bracket and spring (Type A).

### 5- Fixing for naval installation

For naval installations always use a type E bracket every metre and a half of the busbar.

For more installation details, please refer to the installation instructions.

# OPERATING INSTRUCTIONS ON HOW TO DESIGN RISER MAINS

- 1) The RH rising main feed unit (without monobloc) are used at the departure of the riser mains lines, allow the busbar to be installed just 40 mm away from the wall.  
In order to position the tap-off boxes correctly as shown in the figure, the neutral conductor of the riser main must be be on the left side of the element
- 2) The tap-off boxes can be installed in the tap-off outlets (Plug-in type) and on the junction of elements (Bolt-on type)  
The cables come out from bottom part of the tap-off boxes
- 3) Use elements with tap-off outlets where necessary, distribute the power using plug-in boxes
- 4) Use EI120 fire barrier kit for each compartment floor, where specifically requested.  
Note: with aluminum conductors fire barrier is 630 mm long and 1000 mm long where copper
- 5) At the end of the riser mains, position the IP55 end cover

### Maximum hanging distance with springs (Dmax):

In (A)	XCP-S				XCP-HP			
	D max	n° of springs	D max	n° of springs	D max	n° of springs	D max	n° of springs
630	11	4	-	-	10	4	-	-
800	10	4	9	4	10	4	9	4
1000	10	4	8	4	10	4	7	4
1250	9	4	7	4	9	4	7	4
1600	10	6	6	4	7	4	6	4
2000	9	6	6	6	9	6	6	6
2500	12	8	9	8	11	8	5	6
3200	11	12	7	8	11	12	6	8
4000	10	12	7	12	10	12	6	12
5000	8	12	5	12	8	12	5	12
6300	-	-	4	12	-	-	4	12

For 5C version, multiply Dmax by 0.9 (XCP-S) or 0.85 (XCP-HP).  
For 3C version, multiply Dmax by 1.1 for both product lines.

### Spring preload calculation (H):

### Preload calculation example H

Busway type: 5C - Al (Pe1)  
In (A): 2000  
Dmax (m):  $7 \times 0.9 = 6.3$   
D (m): 6  
Busway (Kg/m): 29.6  
Weight box 1 (Kg): 18  
Weight box 2 (Kg): 12

$$W = \frac{29.6 \times 6 + (18 + 12)}{6} = 34.6 \text{ kg} \quad H = 130 - \frac{34.6}{3} = 118.5 \text{ mm}$$

- A) Floor hanger:** use one or more of this suspension brackets, according to the weight of the whole riser mains (including the boxes).  
For risers that are shorter than 4 meters, fix to the base with type D brackets (see pag. 76), when longer, use a type C suspension brackets (see pag. 76) respecting the maximum distances (Dmax) indicated in the tables.
- B) Standard hanger:** use this type of suspension bracket to hang the busbar every 1,5 metres of riser mains.
- C) Wall hanger:** use one or more of this suspension brackets, according to the weight of the whole riser mains (including the boxes).  
For risers that are shorter than 4 meters, fix to the base with type B brackets (see pag. 76), when longer, use a type A suspension brackets (see pag. 76) respecting the maximum distances (Dmax) indicated in the tables.

### Protective bellow

Recommended for protection of the interface connection on electric boards, dry-type transformer with enclosure and oil-type transformers.

There are 3 different types of protective bellows, to be selected according to the type of busbars.

### Protective bellow

The bellows on this page refer to products with standard dimensions. For need of customized solutions, please before take contact with our engineering department.

**Note:** for more details on Protective cover for outdoor applications, please contact Starline.

# FLEXIBLE BRAID CONNECTIONS

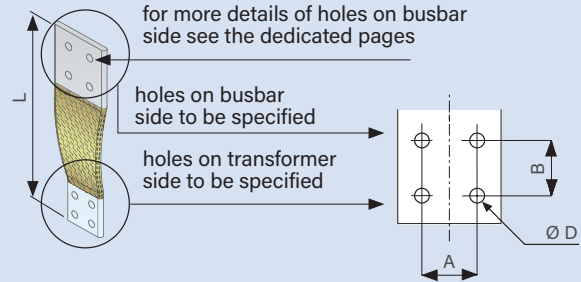

Flexible

Flexible braided connections are used to connect the transformer to the connection interface of the busbar when mechanically uncoupling the two elements is required, to prevent the transmission of vibrations.

Item		Flexible braided connections

## Dimensions

### Flexible

When ordering, specify:  
holes on transformer side/busbar side (dimensions A, B, Ø D) and length L

For need of customized solutions, with special drillings, please before take contact with our engineering department.

**Note:** for insulated flexible braid, please contact Starline.

# ATR ELEMENTS

## ATR elements

ATR are elements used for connection to electric boards or transformers, similar in everything to straight elements. These elements may be used for connection to both cast resin and oil transformers, and offer the advantage that the connection interfaces may be installed directly on the vertical section of the transformer terminals, minimising the time required for the connection of the busbar trunking system to the transformer. Each element is designed based on precise connection specifications supplied by the customer.

**Note:** for special dimensions, please contact Legrand.

## Dimensions

## ATR dimensions

Although designed ad-hoc, ATR elements are still subjected to construction limits.

Below are the summarizing tables indicating these values:

MINIMUM INTERAXES (mm)									
FEEDER ELEMENT ATR DIMENSIONS [SINGLE BAR]									
BarSize	H	B	C	D	E	F	L	U

# TECHNICAL INFORMATION

## The system: the Legrand transformer advantage

Legrand  
Cast Resin Transformers

Certificate of conformity for the connection between transformer and busbar mounted on CRT box

## The system: the Legrand XL<sup>3</sup> advantage

### Installation kit for XL<sup>3</sup> cabinets

Kit Cat.No 0 205 29 for reinforcing the roof of the XL<sup>3</sup> cabinets for the installation of the Legrand interface to connect the busbar systems.

The Super Compact - XCP-S range can be easily and immediately combined with the Legrand XL<sup>3</sup> 4000 cabinets. The reinforcement kit enables you to install any type of unit to the board onto the roof of the XL<sup>3</sup> structure in a quick and easy way.

Upon request, and with the specific measurements, custom made connections between the XCP-S interface and the DMX air-circuit breaker can be supplied for installation in the XL<sup>3</sup> cabinets.

The safety and the operational efficiency of the Legrand system are guaranteed by the system certification, achieved after rigorous tests carried out in the most important international laboratories.

For more details about the XL<sup>3</sup>, please refer to the general Legrand catalogue.

The Legrand group product synergy answers to the global installation need. The Legrand cast resin transformers have specifically designed connections for the Legrand busbars.

The versions shown represent some of the standardized solutions.

 Please contact Legrand for more details on the dimensions

# TAP-OFF BOXES

Tap-off boxes from 63 to 630 A

The new range of universal tap-off boxes suitable for both XCP-S and XCP-HP

Available in 2 different materials: fiberglass and metal sheet, both characterised by a simple installation and fast connection thanks to the new layout of the hooks that offer safety and assembly speed.

# FIBERGLASS TAP-OFF BOXES - 63 A TO 250 A : PLUG-IN TYPE

50485231

50485343

IP55.

Equipped with a sectioning cover. It can be installed and removed when the busbar is energized. To be applied on elements with any rating, with tap-off outlets. Its rating goes from 63 A to 250 A.

Item	Tap-off boxes DPX <sup>3</sup> ready*	
	Prepared for Legrand MCCB (not provided) and available in 2 versions, one with hinged cover and one with completely removable cover. Supplied "ready for" DPX <sup>3</sup> , with rotary handle already installed on the cover and rotary mechanism inside the box.

## WARNING

The bolted boxes are to be installed when the busbar is disconnected and not energized.

In order to finalize the order, it is necessary to specify the type of XCP the box will be installed on.

Tap-off boxes can be pre-equipped with DPX moulded case circuit breakers (MCCB) upon request.

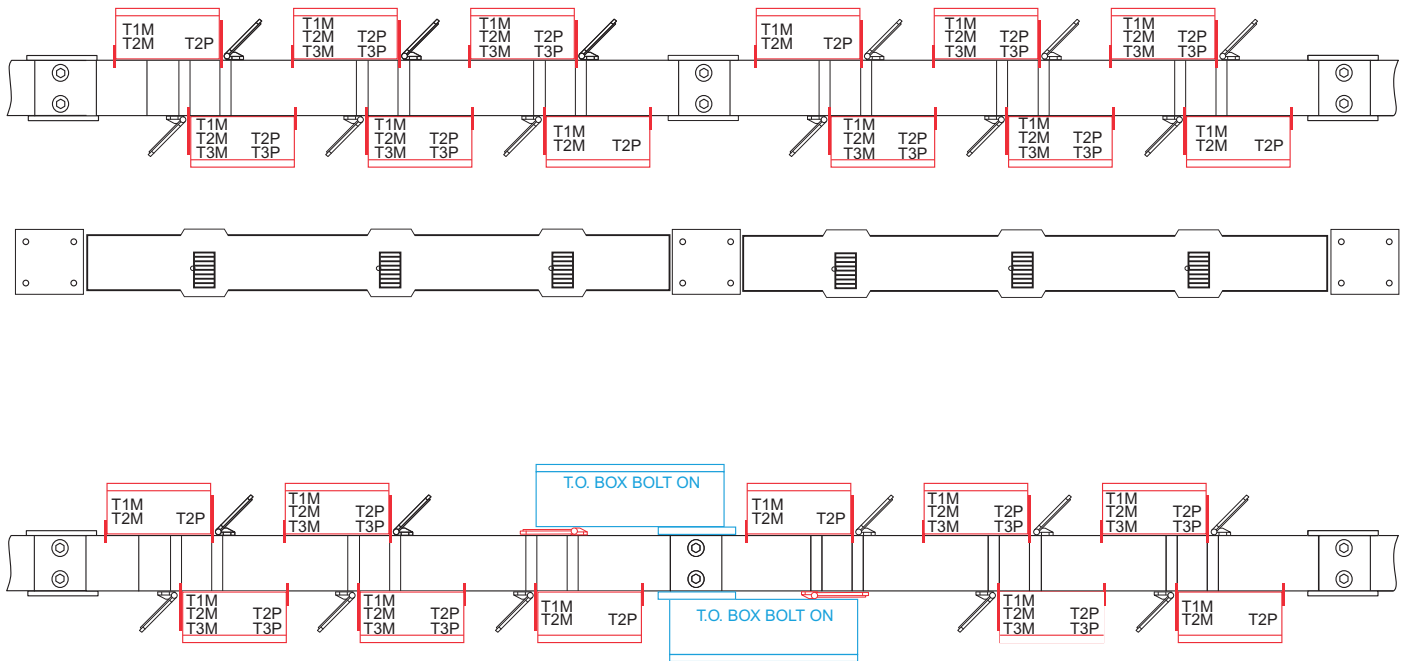

Please contact Starline for more details on the dimensions.

### DC Options (M/V60)

- S** Standard (High Voltage\*)
- P** Standard (48vdc)
- D** Display (High Voltage\*)
- Q** Display (48vdc)

\*M60 Meters support: High Voltage: 120 to 300 VDC/Split Phase 120 VDC (+/-6z0) to 380 VDC (+/-180) OR Low Voltage: 48 VDC

**IN OPTION 9** you are able to select metering for your plug-in unit. Starline Critical Power Monitors are the best options for plug-in units, for either AC or DC voltages.

The communication options include:

- Single Ethernet + WiFi
- Single Ethernet
- Dual Ethernet
- Dual Modbus + Dual Ethernet

The difference between 'M' and 'V' on AC metering is that M50 series meters are capable of monitoring the current of the entire unit, and V50 series meters are capable of monitoring up to 6 individual devices limited to 6 solid core Current Transformers (CTs). Each unit is calibrated for accuracy and is within 0.5% to meet Revenue Grade requirements.

M/V56 and M/V57 meters also have the capability to sense circuit breaker position (on/off) for up to two breakers.

## 11. Meter Configuration

\* Example of drawing to attach

**Example for quotation check list:**

**Checklist to be done during the project**

1. Verify the measurements of the drawings, the correct position of the equipment (MV/LV transformer and LV electric board enclosures).
2. Check the availability of drawings required (transformer, electric board, etc.).
3. Check for the existence of unforeseen obstacles in the installation which could impede the run of the Busbar (for example pipelines, ventilation and air-conditioning ducts).
4. Agree upon who is responsible for providing the connection from the Busbar to the other devices (MV/LV transformer and LV electric boards).

**Example of detail of the project**

**Starline provides without charge, if required:**

- The mechanical layout of the project
- Study of the connections between the Busbar and the transformer or between electric board enclosures
- Suggestions for the type of fixing (floor, wall, ceiling...)
- Possibility of site measurement by qualified persons
- Telephone assistance during the entire installation stage by the Engineering Design Office

# INSTALLATION GUIDELINES

## Installation sequence of the junction

The installation instructions are placed on every element near the junction.

Make sure that the contacts are clean.

Join the two elements together (Fig.1).

Make sure that the earth plate of the straight element is inserted behind the front plate of the junction monobloc (Fig.2).

The positioning pin on the monobloc should be fitted into the corresponding slot on the earth plate.

Verify the distance between elements, 270mm, before tightening the monobloc completely (Fig.3).

Tighten the bolt of the monobloc until the 1st head breaks off (Fig. 4).

The bolt that tightens the monobloc has a second head which is used when carrying out operations or inspections on the line.

The nominal tightening torque is 85 N·m.

**In standard execution the self-shearing bolt is fitted on the opposite side of the Neutral.**

Install the covers of the junction (Fig. 5).

Connection completed correctly with Protection degree IP55 (Fig.6).

# MECHANICAL DESIGN PRECAUTIONS

Below are some precautions that may be useful to avoid problems during the assembly, which we recommend should be taken into account during the design.

## Minimum distances from the structure

The minimum distance from the walls, to avoid problems during edgewise installation of the busbar, is 300 mm. The variables that must be taken into account for correct assembly are:

- position of the bolt for tightening the Monobloc; the minimum required distance is 100 mm;
- sizes of the distribution element (box) selected for the collection of power (at least 300 mm);
- any brackets and their assembly;
- accessibility to the screws for the installation of the brackets and the closing of the junctions;
- any material required for the actual installation in order to compensate for wall imperfections.

In case of rising mains installation, if the system does not require fire barriers, the bracket supporting the busbar can be directly secured to the wall. Otherwise, allow for a spacing support between the bracket and the wall, to ensure that the back of the busbar remains at a distance of 100 mm from the wall, therefore ensuring enough space for the positioning of the partitions.

## Minimum distance of the wall / ceiling elements

When there are tap-off units along the busbars, the minimum distances depend on the dimensions of the tap-offs selected

# MECHANICAL DESIGN PRECAUTIONS

The minimum distance from the junction to the point the busbar crosses the wall or other structure must be at least 200 mm, to ensure the junction of the junctions. In case plug-in boxes and fire barriers are required on the same element the minimum distance between the box and the partition must be taken into account, at the same time allowing for the necessary free space in the junction area and the minimum distance between the distribution outlet and the start of the element. By taking all these variables into account, it is possible to obtain the minimum size of the element in order to be able to fit the partition and the plug-in box. The tables that follow summarise the minimum sizes

Referred to Aluminium

PLUG-IN TAP OF BOXES (X MINIMUM SIZE)		
Type	Rating (A)	X (mm)
1	63 - 160	520
2	250 - 630	720
3	125 - 400	620

Referred to Aluminium

PLUG-IN BOXES ON THE JUNCTION		
Type	Rating (A)	X (mm)
-	125 - 400	700
-	630	820
-	800 - 1250	1120

## Connection to the board

As a rule, the manufacturer of the board is responsible for connecting the connection element and the distribution busbars inside the board. On request Legrand may develop and supply the connections, subject to all necessary details being available. All types of connections must be agreed and checked with the board manufacturer.

## Short circuit withstand

The short circuit withstand of the connection elements depends on the connection of the busbars inside the distribution board. The declaration of short circuit withstand for the system busbars may only be supplied by the board manufacturer. When using Starline boards and Starline busbar trunking system it will be possible to obtain a short circuit certification.

# MEASUREMENT OF SPECIAL ELEMENT LENGTHS

## Measurement of straight elements

The exact length of the piece to be ordered can be determined by measuring the distance between the elements (as shown in the picture) and then subtracting 270 mm from the dimension that has been taken.

$$A \text{ (Length of element)} = Q - 270 \text{ mm}$$

Example: Dimension measured  $Q = 2500 \text{ mm}$   
Order a element  $(2500 - 270) = 2230 \text{ mm}$  (quote A)

## Measurement of the size for the ordering of a special path element

### Horizontal elbow

the exact length of the piece to be ordered can be determined by measuring the dimensions  $Q1$  and  $Q2$  (as shown in the picture) and then subtracting from each dimension taken the values indicated below.

Dimension of the element to order:

XCP-S:  $A = Q1 - 75 \text{ mm}$   
 $B = Q2 - 75 \text{ mm}$

XCP-HP:  $A = Q1 - 72.5 \text{ mm}$   
 $B = Q2 - 72.5 \text{ mm}$

# INSULATION TECHNOLOGY

## Superior moisture-free insulation technology

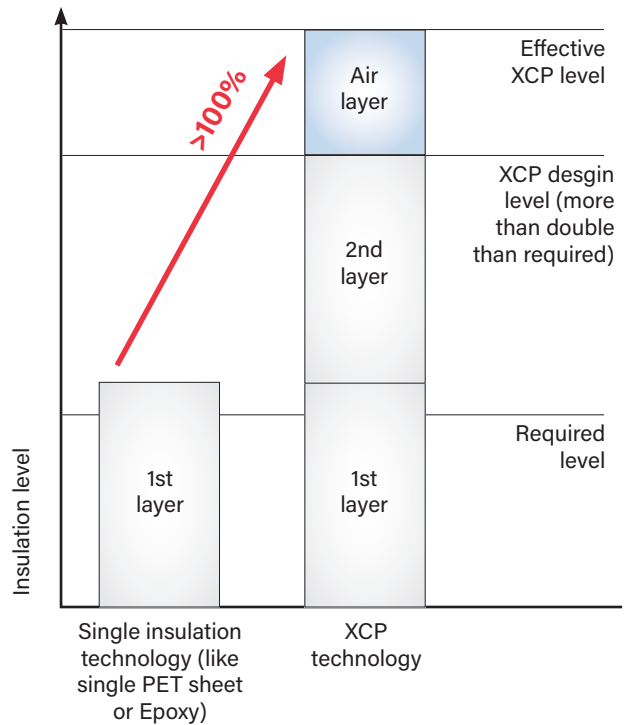

The busbars of the XCP series are insulated by wrapping PET film. To get superior quality and safety, conductor bars are wrapped with two sheets, and each of them is enough to ensure the complete dielectric level required. Therefore, the second sheet has the function to double insulate so to ensure the safety of the bar also in the remote case of failure of the first sheet. The PET films used to insulate the bars are non-hygroscopic and therefore their dielectric performance are independent of air humidity.

XCP construction follow a sandwich logic. In this way free air circulation is not possible inside the case. Thanks to this geometry, penetration of humidity and dust is prevented (IP55 or IP65 on request), whichever is the spatial orientation of busbar elements. In any case, an energized bar has a temperature higher in comparison to the surrounding atmosphere, and this prevents any possibility of condensation of eventual moisture an event that can only happen on colder surfaces. So, thanks to the double insulating layer technology together with the sandwich construction, XCP range is fully protected from any problem that can occur from humidity.

## Totally Enclosed Housing

PET is non-hygroscopic and therefore preserves its performance whatever is the moisture entity. What could be affected by its own dielectric performance is the thin layer of air that is inevitably present between the conductive bars and the PET film. In the XCP design these air layers serve to provide an additional insulation level. Consequently, the total isolation level provided by the XCP range is even higher than that provided by the double PET sheet.

\*PET = polyethylene terephthalate the most useful insulation material for the electric and electronics industry, PET it's used for example in the windings of transformers, to insulate the rotor and stators of electric motors
